

## **LCA and urban metabolism: infrastructure, transportation, waste management**

*Alessandra Zamagni, ENEA, Italy*

*Göran Finnveden, KTH Royal Institute of Technology, Sweden*

Assessing the environmental impacts of buildings and transport infrastructure as well as activities such as disposal and potential reuse and recycling of the enormous amounts of waste that we produce is important since these activities are among the highest contributors to man-made environmental impacts. This session will cover many different aspects, both at methodological and practical level, analysing specific case studies related to these sectors.
