

LCA of energy systems

Göran Finnveden, KTH Royal Institute of Technology, Sweden

Milan Martinov, University of Novi Sad, Serbia

Energy systems are one of the most important contributors to global warming even though their impact varies widely depending on primary energy source and conversion technology. This session primarily presents case studies related to the reduction of carbon emissions from energy systems through improvements in energy efficiency, the use of renewable energy resources or carbon capture. LCA of emerging and advanced energy systems are also welcome.
